

Sharp Adds 40.5-Inch ePoster Display Module for Digital Paper Replacement Product Developers

MONTVALE, N.J. — June 9, 2026 — Sharp today announced a new 40.5-inch (diagonal) ePoster paper replacement module. This addition extends the product line into large-format, high-visibility applications, creating new opportunities for paper replacement product developers. The module's size aligns with the international ISO A1 poster standard.

The 3060 x 4320 resolution module (product number LP405A6NW01) combines Sharp's IGZO backplane with E Ink's Spectra™ 6 technology to deliver a paper-like visual experience with a 60k color gamut and ultra-low power consumption. The module can hold a static image with zero power, offering an efficient alternative to the paper waste of printed posters and a more efficient, flexible option than traditional LCD signage.

Expanding ePoster Use Cases

Building on the widely adopted A2 format for closer-range communication, the new A1 size is optimized for visibility at a distance. Ideal applications include indoor storefront displays, in-store promotions, and directional signage.

Support for standardized ISO poster sizes allows developers to scale paper replacement solutions across multiple environments using familiar formats. This makes it easier to extend digital deployments to reduce reliance on printed materials.

Applications for the ePoster Include:

- Advertising
- Cinema
- Education
- Healthcare
- Hotels & Hospitality
- Lobbies
- Restaurants
- Grocery & Retail

Designed for Flexible Deployment

Sharp's ePoster modules are engineered for low-power operation and simplified installation of the finished product. The lightweight, thin design supports deployment in locations where power is unavailable, including battery-powered configurations—without the thermal and energy demands of LCD displays.

Roadmap Expansion

Sharp continues to expand its ePaper display roadmap to support a broader range of applications. A 20.2-inch A3 display for close-range, tabletop use is in development, along with an outdoor-capable A1-size Kaleido™ 3 module.
